- 2 Components
- Workflow
- Arduino Programming
- I/O Pins
- Examples

Outline

```
Blink | Arduino 1.8.7
File Edit Sketch Tools Help
Blink
/*
 * Blink
 *
 * Turns an LED on for one second, then off for one second, repeatedly.
 *
 * Most Arduinos have an on-board LED you can control. On the UNO, MEGA and ZERO
 * it is attached to digital pin 13, on MKR1000 on pin 6. LED_BUILTIN is set to
 * the correct LED pin independent of which board is used.
 * If you want to know what pin the on-board LED is connected to on your Arduino
 * model, check the Technical Specs of your board at:
 * https://www.arduino.cc/en/Main/Products
 *
 * modified 8 May 2014
 * by Scott Fitzgerald

 * by Daniel Zespiger
 */

// the pin the LED is attached to
const int ledPin = 13;

// the time the LED is on for in milliseconds
const int delayTime = 1000;

void setup() {
  // initialize the LED pin as an output
  pinMode(ledPin, OUTPUT);
}

void loop() {
  // turn the LED on
  digitalWrite(ledPin, HIGH);
  // wait for the specified time
  delay(delayTime);
  // turn the LED off
  digitalWrite(ledPin, LOW);
  // wait for the specified time
  delay(delayTime);
}

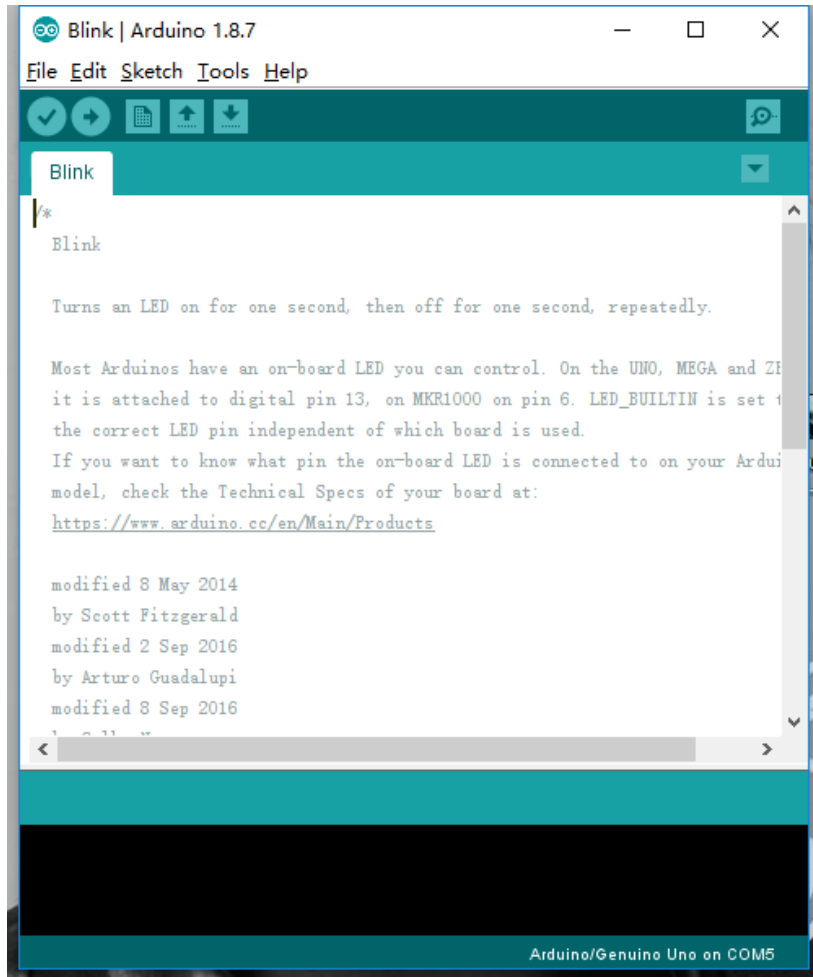

Arduino/Genuino Uno on COM5
```

2 components

- A development board
- Microcontroller
 - Programming hardware
 - USB programming interface
 - I/O pins

The Arduino Development Board

A software environment

- Cross-compiler
- Debugger
- ...

The Arduino IDE (integrated development environment)

The Arduino Development Board

Input / Output Pins

Digital I/O

Analog inputs

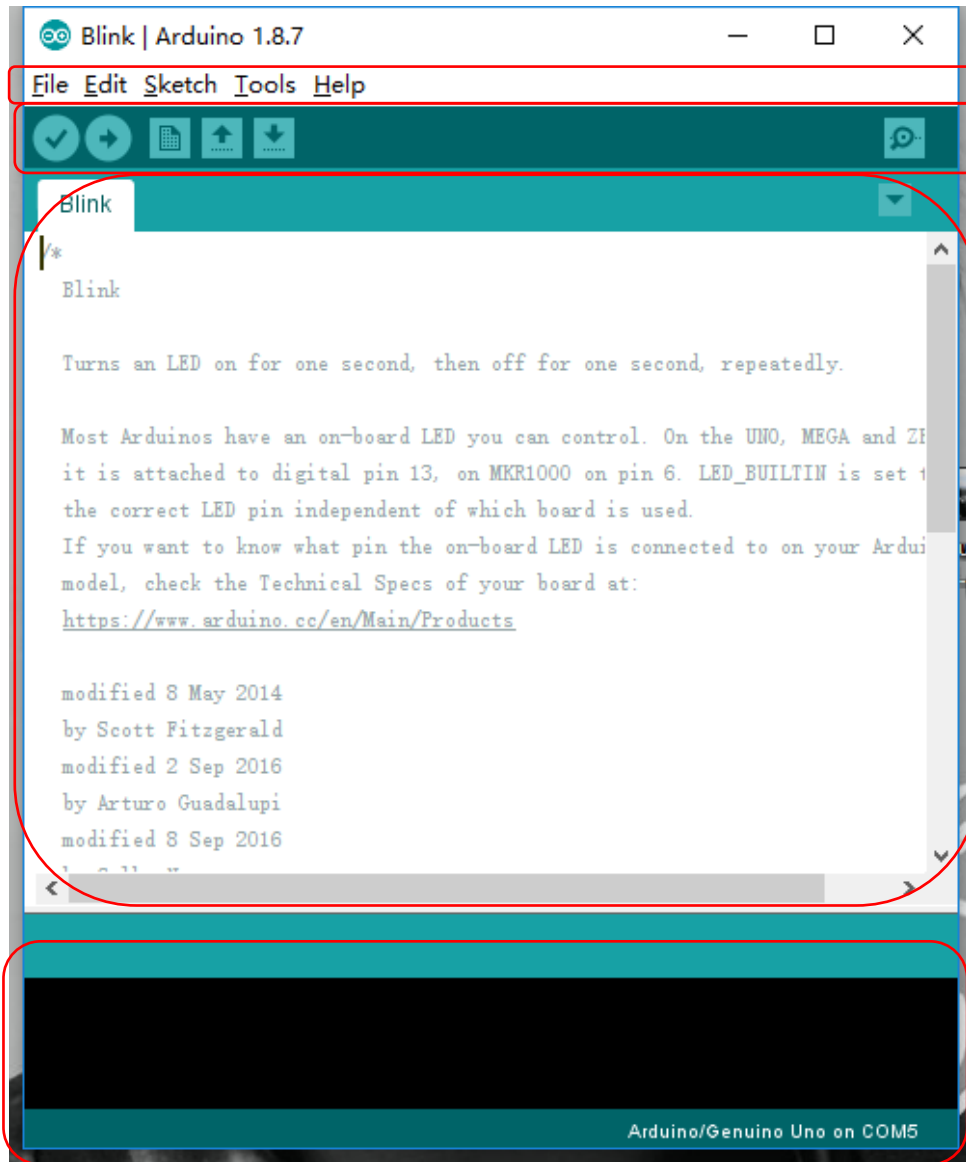

Power / Reset Pins

Microcontrollers

- ATmega328 is the processor programmed by user
- ATmega16U2 handles USB communication

ATmega328

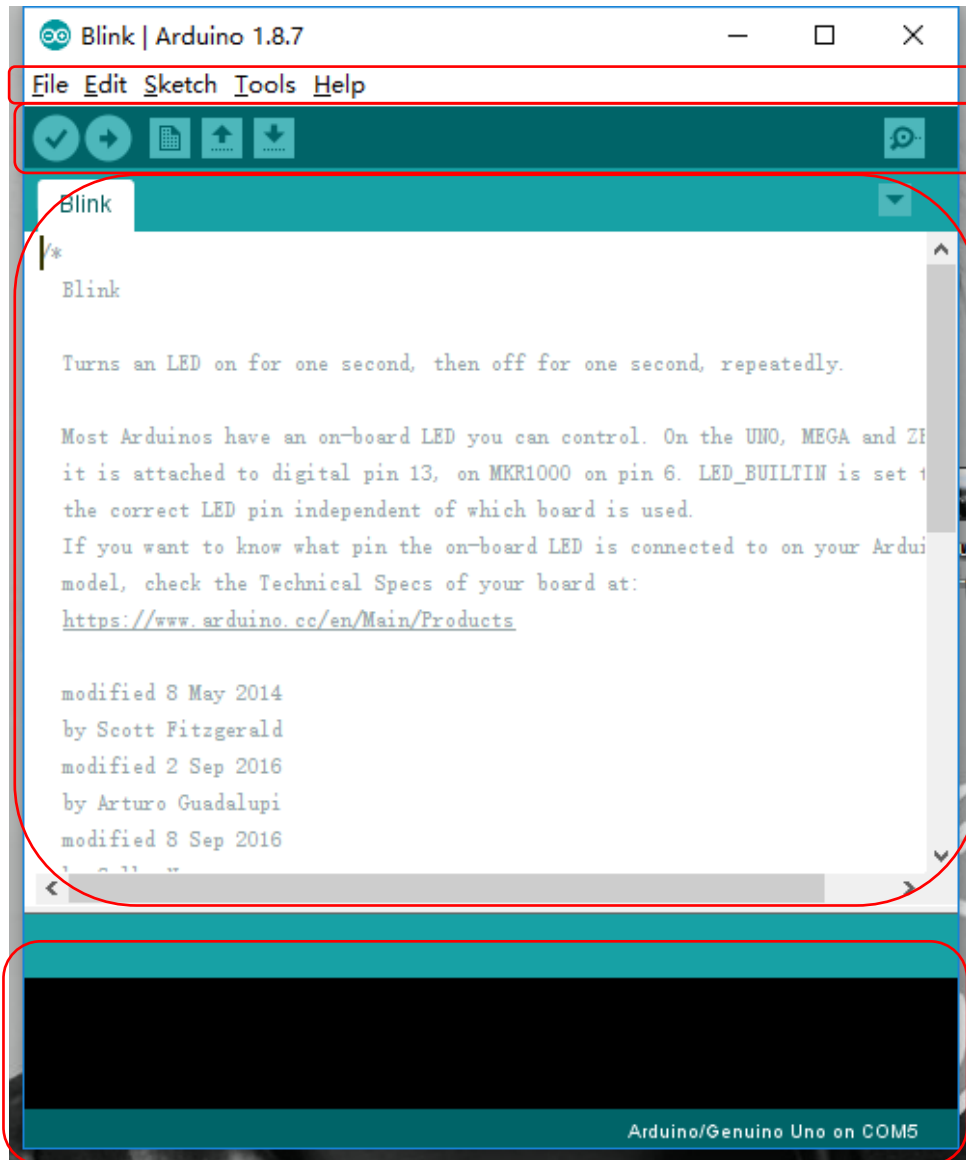

Menus with all commands

Buttons for common commands

Text editor for writing code

Message area

The Arduino IDE

The Arduino IDE

-  **Verify**: Compile codes, checks for errors
-  **Upload**: Compile codes, checks for errors, uploads to board
-  **New**: Creates a new sketch
-  **Open**: Opens an existing sketch
-  **Save**: Saves your sketch to a file
-  **Serial Monitor**: Opens a windows to communicate with the board

Serial Monitor

- Displays serial data sent from the Arduino
- Allows serial data to be sent to the Arduino from the keyboard
- Library functions in the serial library: <https://www.arduino.cc/reference/en/language/functions/communication/serial/>

Basic Setup

- Online tutorial [**Install the Arduino Desktop IDE**]:
<https://www.arduino.cc/en/Guide>
 - Select the one based on the OS of your computer
- Windows tutorial
 1. Download the IDE www.arduino.cc/en/Main/Software
 - Windows/Linux/Mac
 - Also installs USB and other drivers [**If needed**]
 2. Connect the board to your computer
 - Use USB cable
 3. Launch the Arduino application
 - Start the IDE

Launch the Arduino IDE

4. Open the Blink example: File > Example > Basic > Blink

Run a Program

5. Select your Arduino in the Tools button > Board menu > Arduino Uno
6. Select your serial port in the Tools button > Port menu
 - There should be only one selection (COM3, etc)
7. Upload the program with the upload button
 - This writes the program onto the Flash of the Arduino
8. The LED with sign “L” should blink

Arduino Programs

- A program is called a **Sketch**
- C++ program using Arduino library functions
 - Actually almost C
 - You should be familiar with **Classes** in libraries

```
Ethernet.begin(mac);  
Serial.begin(speed);  
Serial.print( "Hello" );
```

Setup() Function

- A sketch does not have a **main()** func
- Every sketch has a **setup()** function
 - Executed once when Arduino is powered up
 - Used for initialization operations
 - Return no value, takes no arguments

```
Void setup() {  
    ...  
}
```

```
sketch_oct09a  
void setup() {  
    // put your setup code here, to run once:  
  
}  
  
void loop() {  
    // put your main code here, to run repeatedly:  
  
}
```

Loop() Function

- Every sketch has a **loop()** function
 - Executed iteratively as long as the Arduino is powered up
 - loop() starts executing after setup() has finished
 - loop() is the main program control flow
 - Return no value, takes no arguments

```
Void loop() {  
    ...  
}
```

```
sketch_oct09a  
void setup() {  
    // put your setup code here, to run once:  
  
}  
  
void loop() {  
    // put your main code here, to run repeatedly:  
  
}
```

Input / Output (I/O)

- These functions allow access to the pins

Void pinMode(pin, mode)

- Set a pin to act as either an input or an output
- **pin** is the number of pin
 - 0 – 13 for the digital pins
 - A0-A5 for the analog pins
- **mode** is the I/O mode the pin is to set
 - INPUT, OUTPUT, or INPUT_PULLUP
 - INPUT_PULLUP acts as input with reversed polarity

Digital Input

`int digitalRead(pin)`

- Returns the state of an input pin
- Returns either LOW (0 volts) or HIGH (5 volts)

Example:

```
int pinval;
```

```
pinval = digitalRead(3);
```

- pinval is set to the state of digital pin 3

Digital Output

```
int digitalWrite(pin, value)
```

- Assigns the state of an output pin
- Assigns either LOW (0 volts) or HIGH (5 volts)

Example:

```
digitalWrite(3, HIGH);
```

- Digital pin3 is set HIGH (5 volts)

Analog Input

`int analogRead(pin)`

- Returns the state of an analog input pin
- Returns the integer from 0 to 1023
- 0 for 0 volts, 1023 for 5 volts

Example:

```
int pinval;  
pinval = analogRead(A3);
```

- Pin must be an analog pin

**Analog
inputs**

Example

- Blink example
 - File>Examples>01.Basics>Blink

Delay

`void delay(msec)`

- Pauses the program for milliseconds
- Useful for human interaction

Example:

```
digitalWrite(3, HIGH);  
delay(1000);  
digitalWrite(3, LOW);
```

- Pin 3 is HIGH for 1 second

```
// the setup function runs once when you press reset or power the board  
void setup() {  
  // initialize digital pin LED_BUILTIN as an output.  
  pinMode(LED_BUILTIN, OUTPUT);  
}  
  
// the loop function runs over and over again forever  
void loop() {  
  digitalWrite(LED_BUILTIN, HIGH); // turn the LED on (HIGH is the voltage level)  
  delay(1000); // wait for a second  
  digitalWrite(LED_BUILTIN, LOW); // turn the LED off by making the voltage LOW  
  delay(1000); // wait for a second  
}
```

Example

- CharacterAnalysis example
 - **Tools -> Serial Monitor**

setup() function:

```
Serial.begin(9600);  
//set the bit rate for serial port.
```

loop() function:

Serial.available(): is True if some inputs.
Serial.read(): read the data byte.

```
void setup() {  
  // Open serial communications and wait for port to open:  
  Serial.begin(9600);  
  while (!Serial) {  
    ; // wait for serial port to connect. Needed for native USB port only  
  }  
  
  // send an intro:  
  Serial.println("send any byte and I'll tell you everything I can about it");  
  Serial.println();  
}  
  
void loop() {  
  // get any incoming bytes:  
  if (Serial.available() > 0) {  
    int thisChar = Serial.read();  
  
    // say what was sent:  
    Serial.print("You sent me: \'");  
    Serial.write(thisChar);  
    Serial.print("\'  ASCII Value: ");  
    Serial.println(thisChar);  
  
    // analyze what was sent:
```

Lab to do today

- 1st: let Led blink 4 times in 1 second and 2 times in 1 second.
- 2nd: write your name to Arduino through serial port, if the name is strictly correct, then the Arduino will return your Student ID.

Requirement

- No lab report.
- You should take a short video and upload to Blackboard.
- In the 1st experiment, you have to show the led blink-blink during at least 5 seconds in the video.
- In the 2nd experiment, you have to sequently show the name you input and your student ID returned by Arduino in the video.

Tips

- For the second lab
 - Use **Tools -> Serial Monitor** to input your name and display your student ID.
 - Use the syntax to read your name:
`String thisString = Serial.readString();`
