- ① TVM Installation
- ② Compile PyTorch Model by TVM
- ③ Homework

TVM Installation

- Recommended System: MAC OS or Linux.
- LLVM 9.0+
- `git clone --recursive https://github.com/apache/tvm tvm`
- `mkdir build`
- `cp cmake/config.cmake build`
- open the LLVM option
- `cmake ..`
- `make -j10`

- `vim ~/.bashrc` or `~/.bash_profile`
- `export TVM_HOME=/Users/baiyang/Documents/Project/tvm`
- `export PYTHONPATH=$TVM_HOME/python:$PYTHONPATH`

- `pip install torch==1.7.0`
- `pip install torchvision==0.8.1`

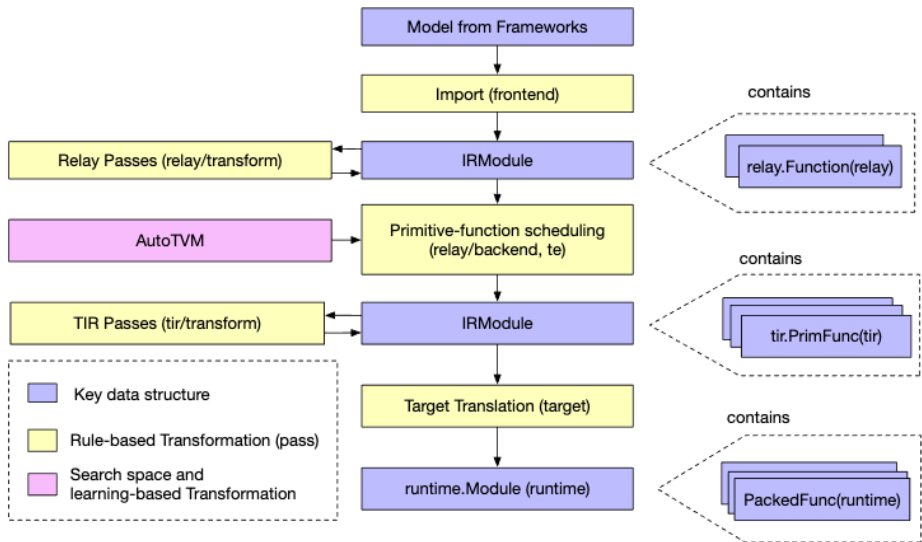

- `import tvn`
- `tnv.__version__`
- `from PIL import Image`
- `import torch`
- `import torchvision`

Compile PyTorch Model by TVM

- Load a pretrained PyTorch model
- Load a test image
- Import the graph to Relay
- Relay Build
- Execute the portable graph on TVM
- Look up synset name

- resnet18
- torchvision

- `img_url`
- Preprocess the image and convert to tensor

- `relay.frontend.from_pytorch`
- `relay.frontend.from_tensorflow`
- `relay.frontend.from_mxnet`
- `relay.frontend.onnx`

- target
- target_host
- relay.build

- Set inputs
- Execute
- Get outputs

- imagenet_synsets.txt
- Get top-1 result for TVM
- Get top-1 result for PyTorch
- Convert input to PyTorch variable and get PyTorch result for comparison

Homework

- Change the `img_path` in your datapath and get the correct recognition
- Change the `model_name` in `torchvision`
- Record the final prediction of your change

THANK YOU!
